Data choice

Use item names and total points: A3:B6 on either sheet. The headings belong in the selection; row 7 does not. A column or horizontal bar chart is suitable for this comparison.

Model checks

Paper 6, card 6, fasteners 4. Total 16. When Model B6 changes to 10, only fasteners rise; total 22. Restore B6=4. The total is never plotted.

Task checks

Initial chart: 20, 10, 8. Paper is highest and exceeds card by 10. After Task B4=12: 12, 10, 8. Paper still leads; the paper-card gap is 2. Total changes from 38 to 30. Keep Task B4=12.

Hinge and parallel check

The total is not a fourth item; it adds the same three items. Re-select A3:B6. A value of 20 is 20 points, not 20 packs. Check the axis unit before making a claim.

Transfer exit

Card uses 8 points; paper and fasteners each use 4. Card uses 4 more points than paper. Favourite item is unknown: no preferences are shown.

Valid comparison

After the change, paper uses 12 points, which is 2 more than card at 10. Accept other accurate comparisons that name items, values and units.

Checks and feedback

Tuesday 1 December 2026 | P6 | 40 minutes

Aspire

Paper-card gap falls from 10 to 2 points. Starting the column scale above zero can exaggerate apparent differences. The chart cannot tell us preferences, reasons, prices or pack counts.

Chart inspection

Check the plotted categories and source ranges. Check that item labels match values. Keep equal intervals and zero baseline. A single series needs no legend if title and labels are clear. Accept readable horizontal bars with the same checks.

If the chart does not update

Check it is a native chart linked to Task A3:B6, not an image. Inspect the data selection and the changed cell. Refresh or recalculate if needed. Record any application issue instead of claiming the update was observed.

If the chart is confusing

Remove the total category, 3-D effect or extra series. Restore the item labels and points unit. Give the chart space so labels fit. Check the source table before changing data to match an expected picture.

One next step

Choose one: fix the data range; label the unit; restore a zero baseline; test the update; use two values in a comparison. Wait for a private pupil response and acknowledge it.

Evidence boundary

An adult-made chart, a supplied model or a correct oral answer does not prove independent digital chart creation. Record exactly what the learner selected, entered, explained and checked.
