Staff Answers

Accept scientifically equivalent responses. Listen once in the pupil's usual mode. Separate access from science cues.

Arrival and Starter

Near: hull and mast. Far: mast only. The Sun, Earth and Moon are approximately spherical. Distance alone makes the whole ship look smaller.

Arrival Independent Q4 · A sphere is three-dimensional. A circle is flat.

Arrival Aspire Q3 · The hull disappears while the mast is still visible.

Arrival Choice Q3 · The bottom, or hull.

I do and checkpoint

The ball casts a round shadow from different directions. A disc may look round face-on and narrow edge-on. Earth's dark shadow has a curved visible edge on the Moon during a lunar eclipse.

We do

Clue	Suggested judgement and reason
Ship at the horizon	Strong. A curved surface hides the low hull first. Distance alone would make the whole ship look smaller.
Shadow during a lunar eclipse	Strong. A sphere makes a round shadow from different directions. A flat disc can make a round shadow from one direction.
Photographs from space	Strong. Repeated images from different viewpoints show the whole Earth's rounded outline directly.
Travel all the way round	Weak on its own. The journey fits a globe, but a closed route by itself does not show the shape of the surface.

Route answers and marking

Accept a different strongest clue when the pupil names the observation, connects it to shape and compares it with a weaker clue. Do not credit a choice without its reason where a reason is required.

Supported

You do. 1 for choosing the eclipse shadow. 1 for linking the curve to a sphere or explaining the limit of a closed route.

Exit. The eclipse shadow. Its curved edge at different eclipses fits a ball-shaped Earth. A trip shows a closed route.

Independent

You do. 1 for a clear observation, 1 for a link to shape, and 1 for a relevant comparison.

Exit. Different viewpoints show the rounded shape repeatedly. One round outline can also be the face of a flat disc.

Aspire

You do. 1 for a defensible choice, 1 for explaining an alternative, 1 for each accurate size comparison and 1 for a valid model limit.

Exit. About 1 cm. For example, the model does not show real distances, sizes, the Sun’s light rays accurately, or Earth’s slight flattening.

Choice

You do. 1 for choosing a stronger clue and 1 for matching a valid reason.

Exit. Repeated space views give a direct view of the rounded outline. The trip gives a route, not a direct view.

Pupil voice

There is no model answer. Listen and use the response to keep a helpful support or make one change.
