Discover: the cell cycle

I am learning to order the cell cycle and explain why a cell makes two matching cells.

Success: order the stages; show matching sets; explain growth or repair.

Discover: the cell cycle

I am learning to order the cell cycle and explain why a cell makes two matching cells.

Success: order the stages; show matching sets; explain growth or repair.

Made by Matt

Route card

Staff: cut these apart before the lesson. Give one route card. Other routes remain available.

Supported

Supported

Supported route card with a model cell

Order interphase, mitosis and cytokinesis. Show A and B in each new cell. [3]

Use Reference A and B and the matching task sheet.

Staff I ☐ S ☐ C ☐

Independent

Independent

Independent route card with a model cell

Order interphase, prophase, metaphase, anaphase, telophase and cytokinesis. Mark the four phases that belong to mitosis. [4]

Use Reference A and B and the matching task sheet.

Staff I ☐ S ☐ C ☐

Aspire

Aspire

Aspire route card with a model cell

Predict what would happen to the sets if copied chromosomes did not separate evenly. Give a reason. [3]

Use Reference A and B and the matching task sheet.

Staff I ☐ S ☐ C ☐

Choice

Choice

Choice route card with a model cell

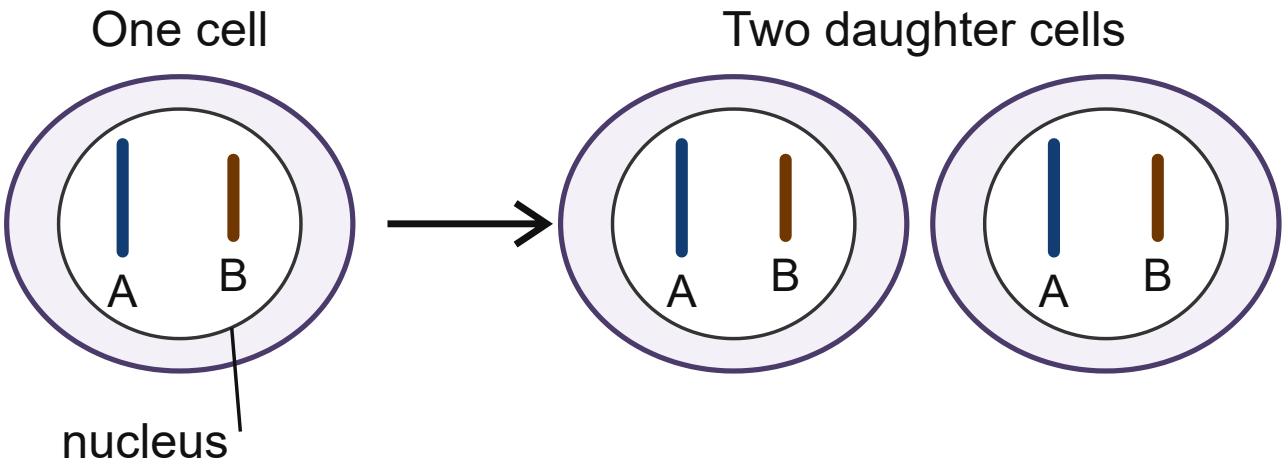

Choose the first, middle and last stage from interphase, mitosis and cytokinesis. Show both A and B in each new cell. [3]

Use Reference A and B and the matching task sheet.

Staff I ☐ S ☐ C ☐

Made by Matt

Reference A matching chromosome sets

Compare the full A and B set in both daughter cells. Each new cell has a matching set.

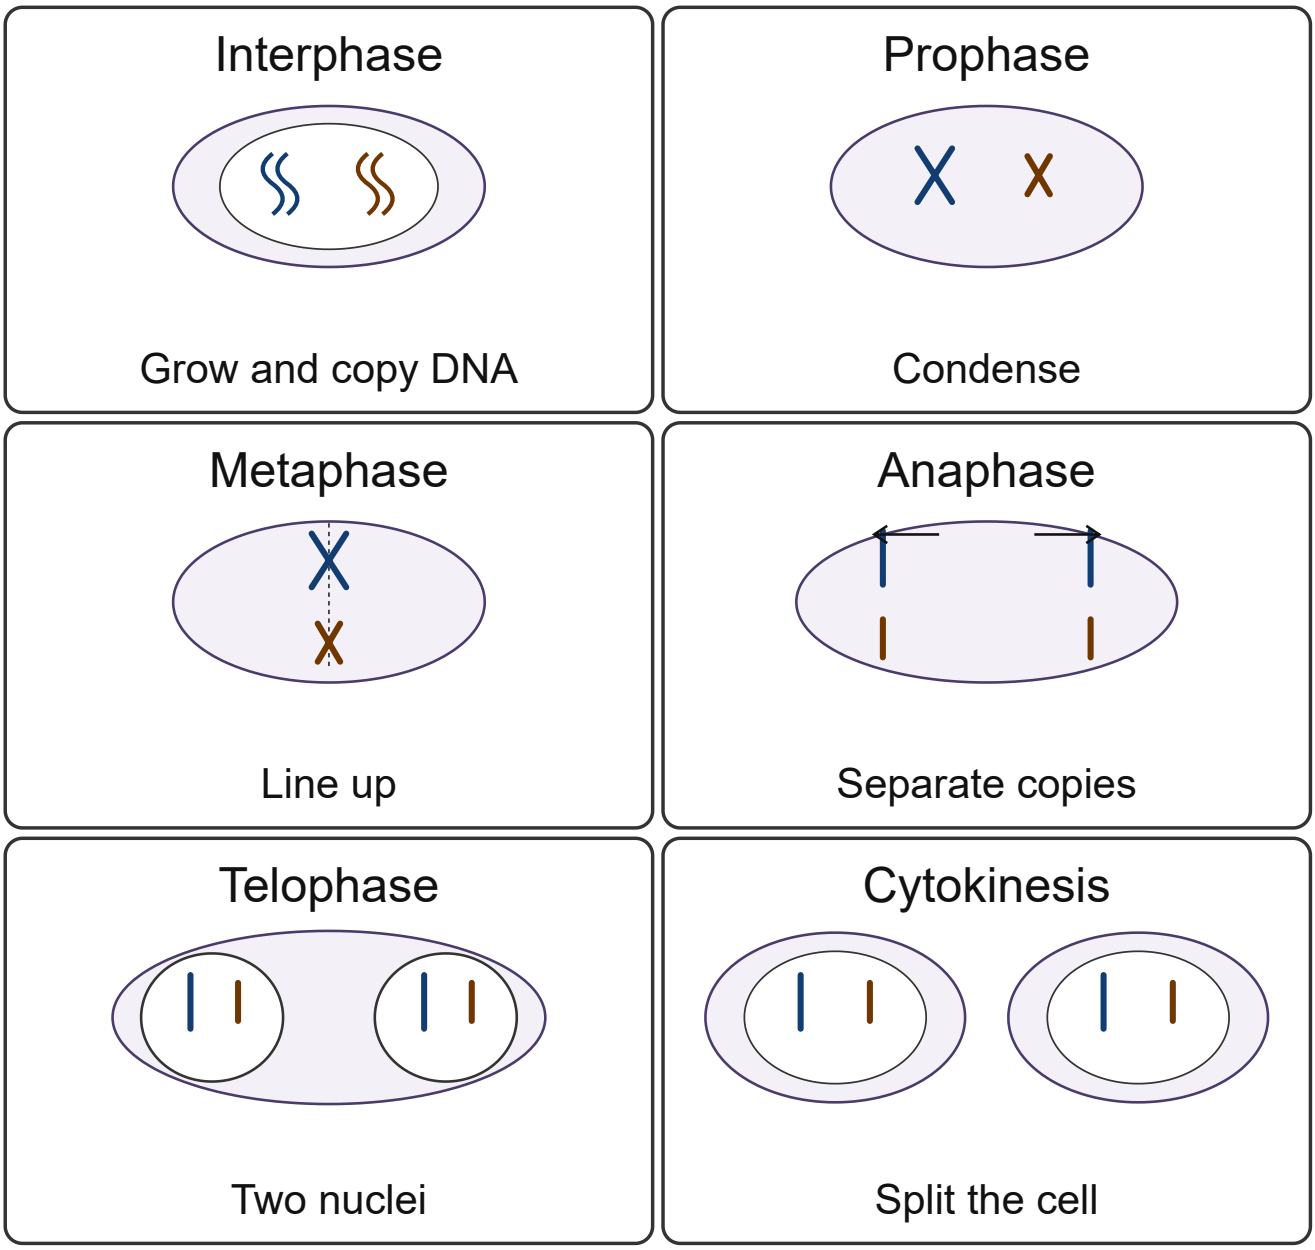

Reference only. Use labels as well as colours. The symbols are simplified chromosome types, not a full picture of real DNA.

Step	What changes
Interphase	The cell grows and copies its DNA.
Mitosis	Copied chromosomes separate into two nuclei.
Cytokinesis	The cell splits into two daughter cells.

In the number case, six chromosomes in the starting body cell means six in each daughter after ordinary mitosis and cell division. A fresh case starting with eight gives eight in each daughter.

Made by Matt

Reference B the six named stages

Interphase, prophase, metaphase, anaphase, telophase and cytokinesis. Four middle phases belong to mitosis.

Reference only. Interphase comes before mitosis. Cytokinesis follows the formation of the two nuclei. The four named mitosis phases are prophase, metaphase, anaphase and telophase.

Science · LAUNCH · Autumn 2 · Week 1 · SCI-LAUNCH-A2-W01-L1

Catch-up sheet absence or access only

Use only after absence or an access barrier. This replaces a starting step; it is not added missed work.

Interphase: the cell grows and copies DNA. Mitosis: copied chromosomes separate into two nuclei. Cytokinesis: the cell divides.

Use Reference A to put the three main stages in order. Check both new sets. Then join the current model or You do task 1.

verbal · written · drawn · signed · symbol / choice-selected · demonstrated / re-attempt · adult-scribed. You may pass.

Made by Matt

Choice task sheet

Select an answer and give a short reason. Use Reference A and B.

1. Choose the first, middle and last stage from interphase, mitosis and cytokinesis. Show both A and B in each new cell. [3] Staff I ☐ S ☐ C ☐

---

2. A body-cell model starts with six chromosomes. Choose three, six or twelve for each daughter cell after ordinary mitosis and cell division. Give a reason. [3] Staff I ☐ S ☐ C ☐

---

3. Choose more matching body cells or fewer chromosomes as the useful result for repair. Explain one link. [2] Staff I ☐ S ☐ C ☐
