The real stand and its useful job

Design and Technology LAUNCH Spring 2 Week 4 Thursday 18 March 2027 P1 Year A

Invented client Sam needs one lightweight paper prompt card, 80 mm wide and 60 mm high, upright and readable on a level table. The whole stand, including its channel, should fit a 160 mm wide by 120 mm deep table area. It should hold the card for 30 seconds with hands away. The card should lift out by hand. Plan safe smooth edges and no loose sharp parts. These are invented design targets, not standards.

Retrieve the actual work

Retrieve the actual approved design, build plan, Week 2 mock-up or Week 3 made item and change log. The default triangular body base is 120 mm by 80 mm; the U channel projects beyond the front. Use the actual approved revised plan if it differs. A missing or unfinished item stays honestly marked. Do not relabel an adult model as pupil work.

What we evaluate today

Strength: how the body and joins support the intended one-card load. Finish: the quality of edges, folds, tape and channel. A neat surface alone does not show strength. A standing card alone does not show that every edge is safe.

The normal use load test

The adult clears the actual item and level table. Use one actual 80 mm by 60 mm lightweight paper card, centrally in the U channel against the slope. Hands away for 30 seconds. Stop at the first concern. Remove the card and inspect. No heavy objects or force are needed.

Improve and keep

Use one real finding to agree a useful safe improvement. Make it with the approved support, then repeat the same one-card check. Keep actual count, time, result and support. If an action cannot happen, mark it pending.
