Hazard report knowledge organiser

Tuesday 23 March 2027 | P2 | 40 minutes | Year A

Humanities | LAUNCH | Spring 2 Week 5 | HUM-LAUNCH-S2-W05

Pink paper version. Read quietly, point, write, type, speak privately or direct a scribe who reads your words back. You may pass. No public answer or reading aloud is required.

Learning outcome: Analyse hazard data (spreadsheets); digital report.
Hazard case-study report (Mar).

This closing lesson combines data analysis and a case report. A–C are three selected October 2026 records frozen on 30 October 2026. H is Japan on 11 March 2011. Keep the source roles and dates clear. The workbook's MAX is one worked example, not evidence of your own digital skill.

Part	What your own work needs
Recent analysis	Newest record/date; shallowest depth; at least one computed comparison; method and a limit.
Japan report	Dated case, cause, primary and secondary effects with because links.
Management judgement	Protection and preparation, how a measure helps, its limit and the warning/prediction distinction.
Actual mode	Record hand analysis, spreadsheet actions, typed report or exact directed work honestly.
Evidence review	Authentic prior work and gaps, adult reply/one NS/own response before R, actual banking before E.

Data limits

Magnitude measures earthquake size; depth is in km. These fields alone cannot rank damage. Three selected records cannot establish a trend or predict the next event. Do not include H in recent-record formulas.

Case and management

Japan 11 March 2011: subduction fault locking and release, shaking damage and tsunami flooding. Physical protection and practised preparation can combine with warnings. A warning detects danger after an event starts; no measure guarantees safety.

Paper and digital evidence

Use your book or the offline tools. Staff record the actual method and help. Paper or adult typing does not establish spreadsheet use or the learner's own digital authoring. The unit award is checked separately.

Where this leads: Geoscientists, data analysts and hazard planners check source limits and explain decisions clearly for an audience.
