Knowledge organiser (SUMMIT) — Piloting, leading and adapting the studio session

Pathway: SUMMIT · Week 6 Part 2 · Big question: How do we run a live pilot of our workshop sequence, spot material bottlenecks, and adapt our instructions?

Core studio focus

Family: Studio suite

Big question: How do we run a live pilot of our workshop sequence, spot material bottlenecks, and adapt our instructions?

• Lead a timed 10-minute live pilot of your Week 5 studio workshop with a partner or small table group.

• Observe where participants hesitate or encounter a material bottleneck (pacing, tool grip, glue amount, or wipe timing).

• Adapt and upgrade your Workshop leadership Board with a concrete improvement before the Week 7 showcase.

Essential vocabulary

• pilot test: A live trial run of a workshop with a small group used to spot and fix problems before the main event.

• bottleneck: A step where participants get stuck, wait for a tool, or take longer than planned.

• iteration: Testing a plan, observing what happens, and making a targeted improvement.

• pacing: Managing the time spent on each step so participants finish a resolved piece before time runs out.

• visual cue: A bold arrow, colour code, or stage sample that clarifies an instruction instantly.

Three-step studio method

Step 1: Lead the 8-minute live pilot: I brief my partner on safety, hand them a pre-cut base blank, and guide them through Tiles 1, 2, and 3 while watching the timer.

Step 2: Diagnose the live bottleneck: I notice my partner pressed the stylus too hard and tore one foil corner because the foam mat slipped.

Step 3: Adapt my board and kit: I tape the foam mat to a backing board, add a bold red tip on Tile 1 ('Use medium pressure on taped foam'), and log my adaptation.
