Pupil studio resources & worksheet — Piloting, leading and adapting the studio session

Pathway: SUMMIT · Week 6 Part 2 · Big question: How do we run a live pilot of our workshop sequence, spot material bottlenecks, and adapt our instructions?

Arrival check

Why do museum educators and studio leaders always run a live 'pilot test' of a new workshop with a partner before delivering it to a wider audience?

[ ] A live pilot immediately reveals which step takes two minutes longer than you expected or needs a clearer visual cue

[ ] If your partner uses too much wash or presses too hard, you can add a bold warning tip to your board right away

[ ] Documenting 'Pilot -> Bottleneck spotted -> Adaptation Made' is top-level leadership evidence

Starter visual cues

Round 1 (Lead the Pilot — 8 mins): Partner A leads their workshop using their 3 stage tiles and pre-cut blanks; Partner B follows the steps.

Round 2 (Swap roles — 8 mins): Partner B leads their workshop while Partner A builds the sample tile.

Step 3 (Diagnose & Adapt — 8 mins): Identify one bottleneck from the trial and upgrade your Workshop board and prep kit.

Vote: What is the smartest response if, during your pilot run, your participant runs out of time on Step 2 (cutting and laminating strips) before reaching Step 3 (patina)?

Studio practice planner

Diagnose your pilot run and lock in your workshop adaptation.

Shapes/Focus: Bottleneck: Cutting took too long, Bottleneck: Foil tore on mat, Bottleneck: Wash stayed too wet, Bottleneck: Dry-brush overloaded

Tools/Methods: Fix: Pre-score/cut base strips, Fix: Tape foam mat + blunt tip, Fix: Add tissue dab at 5 secs, Fix: Add kraft wipe-pad square

Exit ticket

Why do we mount the sample tile our partner made during the pilot onto our studio log sheet?

[ ] It provides tangible evidence that a participant tested our workshop instructions and shows the outcome that informed our adaptation

[ ] Because we forgot to make our own

[ ] To make the sheet heavier
