Muscle Pairs · Knowledge Organiser

Learning goal: I can find a pair of arm muscles and show which muscle pulls to bend or make the arm straight.

Today I Can

I can point to the top and back muscles in an arm.

I can say that a muscle pulls on a bone and never pushes.

I can show which muscle pulls when an arm bends or goes straight.

Must-Know Words

muscle: a body part that pulls on a bone to make it move

joint: a place where two bones meet and bend

pull: when a muscle gets short and tight to move a bone

relax: when a muscle goes soft and long

Core Science Steps

Look at Row 1. When the arm bends up, the top muscle gets short and pulls the bone.

At the same time, the back muscle stays soft and long so the arm can bend.

Look at Row 2. To go straight, the back muscle pulls and the top muscle rests.

Keep the Science Clear

Look at the pulling muscle first. Say: 'The top muscle pulls to bend the joint while the back muscle rests.'

Never say a muscle pushes a bone. Muscles only pull.
