Fair Test · Tier Pack · Aspire

Learning goal: I can plan a fair test by naming what to change, what to measure, and what to keep the same.

Aspire Route (Book First)

Explain why we plan 3 repeat drops for each canopy size and how a human reaction-time delay on the stopwatch could affect the results.

Help: Three repeats let us spot an __ and calculate a reliable middle/mean value. Reaction time adds a small uncertainty to __.

Optional Make It · Aspire

Make a Method Audit & Repeatability Card

Write a 3-point quality check explaining how to prevent release-push errors, why we take 3 repeats, and how to handle an outlier.

Word Help

independent variable: the one factor we change on purpose in a fair test

dependent variable: the factor we measure to see the effect of our change

control variable: a factor we keep the same so the test is fair

fair test: an investigation where only one factor is changed while all others are kept constant

Exit Check

In the parachute plan, what is the one variable we change (independent variable)?

What do we measure (dependent variable) and what unit do we use?

Name two control variables we must keep the same and explain why.
