

Teacher card

How a hazard affects a place / GROW_S2_W02

Outcome: Describe how a natural hazard affects people and places.

Evidence to retain: F: book task, questioning and two exit questions.

Forty minute route

Arrival 4 min; starter 3; model 6; shared task 7; check 2; independent 12; review 3; exit 3.
Pause time is flexible.

Preparation

Choose one independent route. Print the evidence and shared cards, required visual or data sheet, route worksheet and exit. The organiser is one separate A4 page. Keep answers with staff.

Use non-graphic maps and data. A bigger magnitude does not automatically mean greater harm; exposure and vulnerability matter.

Access and regulation

Chunk sources and tasks; pre-teach vocabulary with images. Offer sentence stems, organisers, oral rehearsal and typing. Start with one modelled example; extend through a second source, comparison or supported judgement. Check the learner can begin within two minutes, then fade prompts.

Offer a predictable start, private response and agreed pause. No cold calling or forced personal disclosure. Rejoin at one clearly named next step. Keep teen-appropriate examples and the same learning goal across response modes.

Use sensitive content warnings where relevant. Do not ask for family details or personal experiences.

Assessment

Use questioning and the exit response to decide the next step. Record the learner's individual contribution and the access support used.

UAS: no approved unit code is supplied. Match the learner's evidence to the centre-selected unit and exact criteria before submission. This pack makes no automatic award claim.

Model and answers

Read these pages before teaching. Hide the model during independent assessment.

Question: What hazard followed seafloor displacement?

Evidence: A Japan 11 March 2011: A magnitude 9.1 earthquake occurred off north-east Honshu, Japan. Sudden movement on the subduction boundary displaced the seafloor and produced a tsunami.

Think aloud: A tsunami.

Check: Does magnitude directly count people affected? No. Exposure and vulnerability also matter.

Arrival answers

1. No. They are mainly related to tectonic processes.
2. Related to movement of Earth's plates
3. A tsunami.
4. No. Exposure and vulnerability also matter.

Shared activity reasoning

1. Sudden plate-boundary movement — Cause. Movement released energy and displaced the seafloor.
2. Coastal flooding — Effect. The tsunami affected coastal places.
3. Routes to higher ground — Response. These can reduce exposure when accessible and timely.

Exit responses

What hazard followed seafloor displacement? A tsunami.

Does magnitude directly count people affected? No. Exposure and vulnerability also matter.

Teaching and evidence record

Supplied scheme of work teaching sequence: Locate a hazard; build a cause/effects/responses diagram from case-study evidence, interpret a map/graph and make a short judgement.

Look for

F: book task, questioning and two exit questions.

Accept accurate equivalents, including speech or exact scribing. Check the concept and use of evidence rather than length or handwriting. Record access support separately from content prompting.

BUILD: a concrete example with a reason or demonstrated action. GROW: explain or compare with a relevant detail. LAUNCH: connect evidence and reasoning; use a limitation when the outcome requires it. Keep RE responses non-GCSE.

Media

Original captioned teaching model made for this pack. It demonstrates the supplied reasoning; it is not historical footage, survivor testimony or a documentary. The full transcript and factual source credits are included.

Use manual steps for a calm pace. The silent MP4 has visible captions and a matching text transcript. External archive media is optional and should be previewed before class.
