

Teacher card

Tracking live hazards / LAUNCH_S2_W02

Outcome: Track live hazards online and interpret data.

Evidence to retain: F: data accuracy, interpretation and exit check.

Forty minute route

Arrival 4 min; starter 3; model 6; shared task 7; check 2; independent 12; review 3; exit 3.
Pause time is flexible.

Preparation

Choose one independent route. Print the evidence and shared cards, required visual or data sheet, route worksheet and exit. The organiser is one separate A4 page. Keep answers with staff.

Use non-graphic maps and data. A bigger magnitude does not automatically mean greater harm; exposure and vulnerability matter.

Access and regulation

Pre-teach terminology and model evidence use. Chunk sources and data; provide an initial frame, then reduce it. Maintain normal access arrangements. Extend by weighing limitations, alternative explanations and evidence quality. Adults support access and evidence selection without supplying answers.

Offer a predictable start, private response and agreed pause. No cold calling or forced personal disclosure. Rejoin at one clearly named next step. Keep teen-appropriate examples and the same learning goal across response modes.

Use sensitive content warnings where relevant. Do not ask for family details or personal experiences.

Assessment

Use questioning and the exit response to decide the next step. Record the learner's individual contribution and the access support used.

UAS: no approved unit code is supplied. Match the learner's evidence to the centre-selected unit and exact criteria before submission. This pack makes no automatic award claim.

Model and answers

Read these pages before teaching. Hide the model during independent assessment.

Question: Why record the snapshot time?

Evidence: D Reading a hazard feed: A USGS event row can include UTC time, place, magnitude and depth in kilometres. A short feed is a dated snapshot. It cannot predict the next earthquake.

Think aloud: The feed changes, so the evidence must be traceable to a particular capture.

Check: Can this small sample predict the next earthquake? No. A short event list is not a prediction.

Arrival answers

1. Sudden seafloor displacement during the earthquake moved the water above it.
2. Related to movement of Earth's plates
3. The feed changes, so the evidence must be traceable to a particular capture.
4. No. A short event list is not a prediction.

Shared activity reasoning

Exit responses

Why record the snapshot time? The feed changes, so the evidence must be traceable to a particular capture.

Can this small sample predict the next earthquake? No. A short event list is not a prediction.

Teaching and evidence record

Supplied scheme of work teaching sequence: Record the date/time of a teacher-selected data snapshot; enter a small set in a table, graph it and identify a pattern with a short conclusion.

Look for

F: data accuracy, interpretation and exit check.

Accept accurate equivalents, including speech or exact scribing. Check the concept and use of evidence rather than length or handwriting. Record access support separately from content prompting.

BUILD: a concrete example with a reason or demonstrated action. GROW: explain or compare with a relevant detail. LAUNCH: connect evidence and reasoning; use a limitation when the outcome requires it. Keep RE responses non-GCSE.

Media

Original captioned teaching model made for this pack. It demonstrates the supplied reasoning; it is not historical footage, survivor testimony or a documentary. The full transcript and factual source credits are included.

Use manual steps for a calm pace. The silent MP4 has visible captions and a matching text transcript. External archive media is optional and should be previewed before class.
