Horticulture: soil, seeds & planting.

Our indoor observation crop

Use untreated garden pea seeds checked by the adult. This indoor seedling method suits a January classroom observation activity. Use fresh peat-free multipurpose growing medium in a clean seed tray with drainage holes and a catch tray. There is no tasting, eating or promised harvest.

Our sowing method

Sow seeds 2.5 cm deep and 2.5 cm apart. Use the adult-marked blunt depth guide. Cover gently and water as shown so the medium is damp, not waterlogged. Place in a safe bright position away from heaters. The adult checks the selected seed instructions before the lesson.

Care and recording

Seeds need suitable moisture, air and warmth. Seedlings need bright light. Check before watering; wet medium does not automatically need more water. Record actual growth or no visible change through Week 5. An adult may move crowded seedlings into larger pots or add support; keep the tray code and record the change.
