Safe use knowledge card

White standard edition

Using gardening tools safely.

One tool for one job

Use a hand trowel to scoop medium into a pot. Use a hand fork only in an adult-marked empty area, away from seedlings and root balls. A watering can gives gentle water only when a moisture check shows it is needed. Gloves help protect skin but do not make blades safe.

A safe work routine

Check the tool and clear working space. Walk with tools low and pointed ends down and away. Keep your free hand clear. Park tools before changing jobs. Secateurs stay closed and locked for pupil handling by default; the adult controls blades and cutting.

Finish and record

Brush soil off blunt tools, wipe and dry them, then return them to the agreed dry store. The adult cleans sharp blades. Wash hands with soap and water even after gloves. Keep the original tray code and record real growth and care, including no water needed.

Repot only when the adult judges it needed and ready. Support the intact root ball. If roots resist or tangle, leave the plant and ask. Use an empty pot to practise the sequence instead.
