Growing area maintenance knowledge

White standard edition

Maintaining a growing area.

Checks before jobs

A growing area needs regular checks. Look for unwanted plants, moisture, signs of pests or damage, and clutter on paths and edges. Check labels and tools too. A check can show that no action is needed.

Care without damage

Water only after a moisture and drainage check. Remove only an unwanted plant the adult has identified, without disturbing crop roots. Observe pests or damage and report what you see. An insect is not automatically a harmful pest. Leave unknown plants, fungi, waste or sharp objects to the adult.

A group rota

A rota says which job needs checking, when, the role code and the agreed response. Choose realistic jobs together and read the plan back. Adult daily backup covers absence and nonteaching days. A daily moisture check does not mean daily watering.
