Real tray comparison and conclusion

White standard edition

Record growth (links Science).

Practical job list

1 Choose a measuring, observer or recorder role. Find the original tray and marked-shoot codes.

2 Check the actual Week 2 history with the adult. Keep any invented model figures separate.

3 Measure height using the same endpoint, method and precision in both trays. Do not pull, straighten or uproot the shoot.

4 Count whole expanded leaves at their stem attachments. Do not count leaflets, tendrils or stipules. Record visible condition.

5 Compare like measures, write a short conclusion and add the actual Week 5 entry.

6 Give only needed care. Park tools, clear safe spills and wash hands with soap and water. No tasting or eating.

You may ask for a quiet pause after parking tools and telling the adult.

Check the real history

The adult checks the actual records. Use short notes in your book or tell an adult what to scribe.

History and fairness check	Actual records show
Tray and shoot codes	____
Starting height and age	____
One intended changed factor	____
Crop and seed number alike	____
Medium and containers alike	____
Other care and conditions alike	____
Selection and measuring rule	____
Records confirm since Week 2	Yes / no / partly

History confirmed and one intended factor checked: use a cautious fair-comparison explanation. History missing or other factors changed: label this a current descriptive comparison. Do not claim a treatment history you cannot verify.

Our own current figures

Record selected shoots, not a tray average. Use unavailable if a value cannot be measured.

Real current measure	Tray A	Tray B
Tray and shoot code	____	____
Height in cm	____	____
Opened whole leaves	____	____
Visible condition	____	____

Height difference, if comparable: ____ cm.
Change from baseline, only if both starting values are reliable: A ____ cm; B ____ cm.

My short conclusion

Our figures show ____. This may relate to ____, but ____.

Use height, whole leaves and condition together. State what may explain the difference and what you cannot know. One tray per condition limits the claim.
