White paper version | Read quietly. Point, write, type or use a scribe. No reading aloud is required.

S1 Question and method

SUPPLIED PRACTICE DATA. This is a fictional route through an inland residential neighbourhood. No real place or real collection is represented.

Enquiry question: How does land use differ between two sections of a residential route?

The model survey records the first ten plots on one side of section A and the first ten on one side of section B along a single planned route. A plot is one separately bounded site. The two sections do not overlap.

The model uses one primary land-use code per plot: H homes; S services; W workshops; O open space. Mixed use would be coded by its main visible use and marked for a later check. No mixed-use uncertainty is entered in this practice set.

The stated model observation is one dry weekday morning, in one visit. A recorder enters each plot code in a table, totals each category and checks that each section has ten entries. A graph then compares the counts.

Say “The supplied data describes…” when using this set. Do not say that you collected it. Use the method above to evaluate what this model could show.

Finish

Name the question, site type, unit, sample size and coding rule. Mark the source as supplied. If using your own data, describe what actually happened instead.

S2 Plot records and totals

SUPPLIED PRACTICE DATA. Each row is one model plot in each section. The codes use the S1 key. These are not real addresses.

Plot order	Section A	Section B
1	H	H
2	H	H
3	H	H
4	H	S
5	H	S
6	H	S
7	H	S
8	S	W
9	O	O
10	O	O

Main use	A plots	B plots
Homes	7	3
Services	1	4
Workshops	0	1
Open space	2	2
Total	10	10

Check: each plot appears once. Count plots, not people or floor area. Keep both sections separate. Ten is the total for each section; twenty is the total across the route.

S3 Graph and evaluation guide

SUPPLIED PRACTICE DATA. Use a grouped bar graph for S2. Plot two bars for each use. Start at zero, use one-plot steps and label a zero value.

Suggested title: Sampled land use in two route sections. Vertical axis: Number of sampled plots. Horizontal axis: Main land use. Key: A solid; B hatched. The evidence form provides a blank grid.

Checks

Do the bar heights match S2? Are the section labels clear? Does the title say sampled? Does the graph use an even scale? If an adult supplies a graph, mark that support and check two bars yourself.

Limits to consider

These first ten plots may miss other kinds of street. One side of each section may differ from the other side. A visible main-use code may miss uses inside a building. One visit cannot show changes over time.

Choose one limit. Explain how it could affect a finding. Suggest a change that addresses it, such as more route sections with a planned selection rule or checking uncertain codes with a second recorder.

A pattern in a small sample cannot prove a cause, describe the whole town or rank a community. All supplied values are fictional practice figures.

Finish

Use the data to answer the question in your own words. Link your chosen improvement to the limit you explained.
