Staff answers & diagnostic guide — Makers, tools and visual links

Pathway: BASE · Week 2 Part 2 · Big question: How do makers use layered card shapes to build bold relief art?

Starter answer & explanation

Question: What happens when you glue one card strip on top of another strip?

Correct: It stands up higher and casts a real shadow edge — Yes. Raised layers catch the light and make real shadows.

Guided team check (We do) answers

Q1: How much PVA glue do we spread on the back of a card strip? -> A thin even coat right to the corners (Yes. A thin coat sticks fast without oozing out.)

Q2: Which layer should you glue down onto your base board first? -> The widest back space shapes first. Then smaller bars on top (Yes. Big bottom shapes hold the smaller top bars up.)

Q3: How long should you press a thick card strip down after placing it? -> Count slowly to five with flat fingers (Yes. Pressing for five seconds bonds the card flat.)

Exit check answer

Question: What do we call flat artwork where raised shapes stick up from the base?

Correct: Relief — Yes. Relief art has raised layers on a flat base.
