Staff answers & diagnostic guide — Try it once, then say what happened

Pathway: BASE · Week 4 Part 1 · Big question: What happens when we test sponge tapping and wax resist on our sign?

Starter answer & explanation

Question: Why do we dab a paint sponge straight up and down instead of scrubbing side to side?

Correct: Up-and-down dabs keep a crisp dotty texture and stop paint sneaking under the cut shape — Yes. Dabbing up and down keeps the edge super sharp.

Guided team check (We do) answers

Q1: What happens if you barely press the white wax crayon in Box B? -> Weak wax leaves gaps so dark ink covers the line (Yes. Press firmly with the wax so it makes a solid dry wall.)

Q2: How much paint should be on the bottom of your sponge sponge? -> A light tap on the tray pad so the sponge holes still show (Yes. A lightly loaded sponge prints crisp airy dots.)

Q3: After you try both tricks, what goes at the bottom of your test page? -> A short honest note saying what happened and which one worked best (Yes. Even if a smudge happened, naming it is great studio work.)

Exit check answer

Question: Why does wet water ink roll off a wax crayon mark?

Correct: Wax is oily and dry so it pushes water away — Yes. That dry push is called wax resist.
