Staff answers & diagnostic guide — Resolve and finish the relief artwork

Pathway: BASE · Week 6 Part 2 · Big question: How do we add top details and a neat border to finish our relief panel?

Starter answer & explanation

Question: Why do we wait until the very end to skim chrome bright lines over our raised card?

Correct: So the chrome catches the highest Layer 3 bolt dots and beams without getting covered by glue — Yes. Bright lineing last makes every raised bump and bolt dot glint.

Guided team check (We do) answers

Q1: How do you pick up and place a tiny card bolt dot dot without getting glue all over your fingers? -> Put a tiny dot of glue on the beam first. Then press the bolt dot onto it (Yes. Putting the glue dot on the board first is much neater.)

Q2: Where does light naturally hit a real bridge beam outside? -> Along the top edge and on the highest sticking-out bumps (Yes. Putting white chalk or chrome along the top edge makes it look 3D.)

Q3: When mounting your heavy panel onto the backing frame, how do you make the border even all the way round? -> Line it up inside the four corner pencil ticks on the frame. First pressing down (Yes. Corner ticks keep the border even on all

four sides.)

Exit check answer

Question: Why do we add bright chrome or white chalk to the highest bumps last?

Correct: To catch the light on the raised edges and make the panel look 3D — Yes. Bright high spots against dark low spots create real depth.
