Pupil studio resources & worksheet — Studio skills and safe workshop practice

Pathway: TRACK · Week 2 Part 2 · Big question: How do we score, cut, and laminate heavy card safely to build rigid architectural relief?

Arrival check

Look at the studio safety diagram on your desk. Where must your non-cutting hand always stay when using a safety ruler?

[ ] Behind the raised central guard rail of the safety ruler, never on the cutting edge

[ ] Overhanging the front edge of the ruler

[ ] Holding the card up in the air

Starter visual cues

Rule 1: Always work flat on a cutting mat; stand up when scoring or pressing along a safety ruler.

Rule 2: Make two or three light passes rather than forcing one heavy press.

Join A (Lamination): Glue two strips flat together to double the beam depth.

Join B (Gusset plate): Glue a triangle corner plate over a beam intersection.

Vote: Why is making three light scoring passes along a ruler safer and neater than pressing down with all your force in one go?

Studio practice planner

Select your structural join, relief profile, and surface primer.

Shapes/Focus: Laminated double beam, Triangle gusset joint, Overlapped lattice truss, Riveted arch crown

Tools/Methods: Safety ruler + mat, Thin PVA lamination, Dark slate primer coat, Graphite/chrome ridge skim

Exit ticket

What is the purpose of gluing two or three card strips on top of each other (lamination) in relief art?

[ ] To build deeper 3D height and stronger shadow edges on the main beams

[ ] To waste card offcuts

[ ] To make the board bendy
