Staff answers & diagnostic guide — Studio skills and safe workshop practice

Pathway: TRACK · Week 2 Part 2 · Big question: How do we score, cut, and laminate heavy card safely to build rigid architectural relief?

Starter answer & explanation

Question: Why is making three light scoring passes along a ruler safer and neater than pressing down with all your force in one go?

Correct: Light passes stay tightly against the ruler edge and prevent the tool from slipping or tearing the card — Correct. Controlled light passes give a razor-clean edge and total hand safety.

Guided team check (We do) answers

Q1: Why should you stand up rather than slouching in a chair when aligning a safety ruler on a mat? -> Standing puts your shoulders directly above the ruler so downward pressure holds the ruler rock-steady (Yes. Good studio posture stops the ruler from slipping.)

Q2: What happens when you brush a single dark grey primer coat over brown card, white card, and glue joins? -> It unifies all the different scraps so the eye sees the 3D shadows and relief form as one structure (Exactly. A unified primer coat

transforms scrap card into cast iron.)

Q3: Where do tools go the instant you finish cutting a strip? -> Straight back into the central table block or safety dock before you pick up glue (Correct. Never leave sharp tools loose under scrap card.)

Exit check answer

Question: What is the purpose of gluing two or three card strips on top of each other (lamination) in relief art?

Correct: To build deeper 3D height and stronger shadow edges on the main beams — Correct. Lamination creates real physical depth between front and back beams.
