Pupil studio resources & worksheet — Independent surface and structure challenge

Pathway: TRACK · Week 3 Part 2 · Big question: How can we combine collagraph relief, foil embossing, and monochromatic wash in an architectural panel?

Arrival check

Look at the two architectural relief samples. Sample 1 leaves the card and foil raw; Sample 2 adds a dark wash into the grooves and wipes the top ridges clean. Which looks heavier and more weathered?

[ ] Sample 2 with the dark wash settled in the grooves

[ ] The contrast between dark grooves and bright metal ridges makes the relief pop

[ ] Both show texture, but the wash locks the layers together

Starter visual cues

Stage 1 (Relief build): Combine corrugated background plates with smooth laminated girders and an embossed foil focal plate.

Stage 2 (Tonal wash): Brush dark monochromatic wash into the recessed joints and textures.

Stage 3 (High-point wipe and dry brush): Wipe the raised foil clean and skim dry chrome/chalk along beam flanges.

Result: High-contrast industrial surface with deep recessed shadows.

Vote: When you brush a dark wash over embossed foil and wipe the top surface gently with a tissue, where does the dark ink stay?

Studio practice planner

Choose your structural focus, texture combination, and patina finish.

Shapes/Focus: Riveted girder intersection, Arched viaduct bay, Triangulated tower crown, Layered dockside wall

Tools/Methods: Corrugated fluting + foil, Woven mesh + laminated card, Dark crevice wash + wipe, Oxide + chrome dry brush

Exit ticket

What happens when you brush dark wash over embossed foil and gently wipe the raised top surface?

[ ] Dark pigment stays in the pressed grooves while the raised metal ridges shine brightly

[ ] The foil turns into paper

[ ] The relief becomes completely flat
