Tier pack: Supported route — Analysing curated spaces and audience impact

Pathway: SUMMIT · Week 4 Part 2 · Big question: How do curatorial choices — scale, lighting angle, sightlines, and framing — shape audience meaning in an exhibition?

Supported route studio steps

Step 1: Shine the table lamp from the front and then from the side across your relief panel to spot the deep shadows.

Step 2: Skim chrome or white chalk along the top edges that caught the light.

Step 3: Sketch where the light sits on your Curatorial plan sheet and tick the best wall spacing rule.

Step 4: Write one sentence explaining how side light changes your panel.

Success check

Raking light tested, directional highlights applied to panel, and curatorial sheet completed.

Key words helper

• raking light: A directional light source shone across a surface from a low side angle to throw every bump and recess into deep shadow.

• curatorial intent: The deliberate mood and visual journey a curator designs through spacing, height, and lighting.

• juxtaposition: Placing two artworks side by side so their scales, textures, or forms highlight each other.

Review checklist

[ ] Shine the directional lamp across your panel one final time to confirm your dry-brush highlights match the raking light angle.

[ ] Check that your Curatorial analysis board includes both your lighting diagram and audience impact notes.

[ ] Store your resolved relief panel safely for the showcase.
