Grip or glide? The surface challenge · Tier Pack · Independent

Learning goal: I can explain how friction acts between touching surfaces and judge when grip or glide is useful.

Independent Route (Book First)

Draw a box sliding right with a friction arrow.
Explain one helpful and one unhelpful friction example using the two touching surfaces.

Help: Friction acts between __ and __. It opposes sliding, which helps / hinders because __.

Optional Make It · Independent

Make a two-sided Grip vs Glide card

Fold a card in half. On Side 1 draw a brake pad gripping a rim (arrows included). On Side 2 draw an oiled axle gliding. Complete your book explanation too.

Word Help

friction: a contact force between two surfaces that slide or try to slide past each other

contact force: a force that acts only when two objects or surfaces touch

grip: high resistance to slipping between two touching surfaces

lubrication: adding oil or grease to reduce unwanted friction between moving parts

Exit Check

Which way does friction point when a block slides right?

Name two touching surfaces where high friction is helpful.
