Knowledge organiser · a fair rover test

I can complete two conditions with three repeats each.

I can record every distance and identify the pattern.

I can write or communicate a conclusion, one improvement and one model limitation.

I can carry out a comparative fair test, use repeated distance results for a conclusion and improve the method.

We test one rover on two surfaces. We keep each run. We use the results to say what we found.

Change the surface. Keep the rover, start, ramp and release the same. Release with no push. Measure from the same line each time.

Repeat means do the same test again. Keep each valid result, even if it is a surprise. A failed method needs a note and a repair.

Surface	Run 1 (cm)	Run 2 (cm)	Run 3 (cm)
Smooth	48	51	49
Fabric	27	29	28

These are fixed teaching data. Each smooth run went farther. Friction opposed the motion less on the smooth surface in this model.

A conclusion uses the pattern. Improve one method step for the next test. A classroom model cannot show all real rover conditions.
