

Can we publish this headline?

Learning intention

Use supplied sources and repeated sample data to present a cautious explanation of heart-rate recovery.

“One pulse number reveals perfect health.”

Your research team must check the evidence.

Find the useful science

R1. What does the heart pump?

R2. Why might working muscles need more oxygen?

R3. Which is a number with a unit: “fast” or “96 beats/min”?

I check what was compared

A planned recovery comparison

Constructed method: same activity and duration;
same room, recovery posture and recording method.

I read the method before the numbers. The trials use the same planned conditions. The numbers are a constructed classroom dataset.

I describe a pattern using values

Constructed sample data. Resting value before trial A: 72.

Trial A: 120 immediately after activity. One minute later: 96. Two minutes later: 80. I say “fell towards 72”, not “fully recovered”.

I check repeats before a headline

Repeats: similar is not identical

Constructed sample repeats. Same planned method.
Mean = $(120 + 116 + 124) \div 3 = 120$.

Immediate values vary: 120, 116, 124. Similar repeats strengthen a pattern description. A mean summarises; it does not diagnose health.

Evidence desk: find the pattern

Use the table and source cards on page 1. W1. Describe the pattern in all three trials. Use two values and name the units.

Measurement	A	B	C
Before activity	72	72	72
Immediately after (0 min)	120	116	124
After 1 min recovery	96	92	100
After 2 min recovery	80	76	84

Constructed sample data only. All rates are beats per minute.

Which source helps explain it?

W2. Compare source A, B and C.

Choose one most directly relevant to heart-rate change.

Explain what the source cannot establish.

Write a better research headline

W3. Repair: “The fastest recovery proves the healthiest person.”

Use “in these sample trials” and a limitation.

A, B and C are three trials

Which conclusion matches the dataset?

- A** Person B must be healthier than person A.
- B** All three sample trials show heart rate falling during recovery.
- C** Every trial is back to 72 after two minutes.

Prepare the research briefing

Choose one response route.

Include claim, evidence, explanation and limit.

Credit source A or B by organisation.

Use the reporting frame

“The sample data show ...”

“For example ... beats per minute.”

“NHLBI explains ... ; we cannot conclude ...”

Check your headline

Are A, B and C labelled as trials?

Have I kept units and sample-data label?

Have I avoided a diagnosis or fitness ranking?

Research editor check

Show one claim and its numerical evidence.

Ask whether the limit is clear.

Improve the headline before sharing.

Choose the next evidence question

Which would help: more repeats or an unsupported advert?

Propose one precise improvement to the method.

An honest research result

- E1. Give one pattern with two values.
- E2. Name the relevant source organisation.
- E3. Give one limit to the conclusion.
