

The wildlife archive is mixed up

Learning intention

Describe the life cycles of a mammal, an amphibian, an insect and a bird using named examples.

Four displays have lost their stage labels.

Your job: repair the science, then explain the arrows.

What changes as animals grow?

R1. What are offspring?

R2. Is a young bird already a mature adult?

R3. Does one named example prove a rule for every animal?

I explain each frog arrow

Common frog: changes across generations

Adult → eggs means offspring,
not the adult becoming an egg.

Eggs hatch into tadpoles. Tadpoles develop into froglets. The adult-to-egg arrow means reproduction.

I check for a pupal stage

Monarch: complete metamorphosis

The pupa is a living development stage.
Reproduction produces the next generation.

The monarch has four named stages. A caterpillar is a larva. The pupa is alive and developing.

I keep the animal name in the claim

Rabbit and robin: two named life cycles

European rabbit

Robin

Mature adults can reproduce to produce new offspring.

Rabbit young are born alive and feed on milk. Robin young hatch from eggs. Both young animals grow and mature.

Repair three archive labels

Use page 1 cards A–F. W1. The frog display says “egg → adult → tadpole → froglet”. Repair it and explain two arrows.

Display	Suspect label
Frog	Egg → adult → tadpole → froglet
Monarch	Egg → larva → adult; pupa deleted
Animal guide	All mammals give live birth; all insects have a pupa

Authored archive errors for pupils to repair.

Recover the missing stage

W2. The monarch display has lost its pupa.

Where should it go?

Explain why “it does nothing” is misleading.

Challenge the word all

W3. Test both guide claims using cards E and F.

Name a counterexample for each.

Write a more careful statement.

What does the returning arrow mean?

In a cycle, an arrow goes from an adult to eggs.

- A** The same adult turns into an egg.
- B** Reproduction produces the next generation.
- C** Every stage takes exactly the same time.

Build a reliable display

Choose supported, standard or stretch.

Use page 1 as your evidence archive.

Include all four core animal examples.

Check what your arrows say

Hatching, growth and development are not the same as reproduction.

Name the species.

Mark which arrow leads to offspring.

An audience checks the display

L1. Show or describe one sequence.

Audience: “Which arrow starts the next generation?”

Revise one unclear label.

A smaller animal is not always an adult

A fledgling robin has left the nest.

A froglet looks like a small frog.

Both still develop and mature.

Three final archive checks

E1. Name the monarch stage after larva.

E2. Name a young stage in the frog or robin cycle.

E3. Explain the adult-to-offspring link.

Choose a useful next step

Stage order • explanation of an arrow • a careful claim.
