

A pollen delivery mystery

Learning intention

Describe pollination, fertilisation and seed formation as different connected processes.

Pollen reaches a plant. Does that guarantee a seed?

We will follow the destination and the next processes.

Recover the plant words

R1. Name a flowering-plant part.

R2. What can a seed grow into in suitable conditions?

R3. Does reproduction mean the parent grows taller?

I trace the correct delivery destination

Pollination: pollen reaches a stigma

Selected structures only; not to scale. Petals are omitted.

Anthers produce pollen. A stigma receives pollen. Pollination names this transfer.

I distinguish the event inside the ovule

Fertilisation happens after pollination

One key fusion is shown; advanced double-fertilisation detail omitted.

Compatible pollen can grow a tube. A male gamete reaches an egg cell. Their fusion is fertilisation.

I name what develops into a seed

After fertilisation: identify the structure

A seed contains a young plant embryo; fruit surrounds seeds.

The fertilised ovule develops into a seed. The ovary develops into fruit. A pollen grain does not turn into the seed.

Orchard evidence desk

Use records A–F. W1. Which record shows pollination? Which record shows only pollen in the wrong place?

Observed record	What can we establish?
A: anther → suitable stigma	Pollen transfer
D: pollen on leaf	Wrong destination in this record
E: pollen on stigma; inside unseen	Transfer, but fusion not observed

Audit the missing step

W2. Put A, B and C in process order.

Explain what changes from transfer to fusion to development.

What does the evidence prove?

W3. Record E has pollen on a stigma.

Can the observer claim fertilisation definitely happened?

Give the strongest claim that the record supports.

Which structure becomes a seed?

Choose the scientifically accurate explanation.

A The pollen grain simply changes into a seed.

B A fertilised ovule develops into a seed.

C A leaf changes into every seed.

Your independent investigation

Choose one response route.

Trace the flower-to-seed sequence.

Use records to separate observation from inference.

Use the evidence

Name the destination: anther to stigma.

Distinguish transfer, fusion and development.

State what the observer has actually seen.

Check before sharing

Does my explanation answer the question?

Have I named the evidence or process?

Have I kept the conclusion within its limits?

Compare and improve

Share one accurate arrow or process label.

Check it against the source cards.

Improve a seed or fertilisation claim.

A question worth investigating

Suggest one next question about this lesson's evidence.

Choose a question whose answer would improve our model.

Show the science you can explain

E1. What is pollination?

E2. How is fertilisation different?

E3. What develops into a seed?
