Teacher and cover plan — Material implementation and critical development

Pathway: SUMMIT · Week 3 Part 2 · Big question: How do we translate our Week 1-2 studio brief and joint prototypes into a multi-level structural relief build?

Learning goals and studio kit

• Construct the primary and secondary structural planes of your site-specific relief panel following your Week 1 elevation.

• Integrate laminated load-bearing spans, negative-space voids, and embossed metallic gussets with precision joinery.

• Apply a base monochromatic ground and record a mid-build critical log note on structural tension and shadow depth.

Studio kit: Week 1 Studio briefs, Week 2 joint prototypes, A3/A4 heavy greyboard bases, cutting mats, safety rulers, corrugated fluting, craft foil, dark acrylic primer, PVA

Arrival and starter

Arrival: Open your Week 1 elevation brief and your Week 2 corner-joint prototype. Which plane of your main relief board must be engineered and bonded first?

Starter question: Why do we build laminated double-thickness beams for Plane 2 and Plane 3 rather than using single thin paper strips?

Teacher model (I do)

Step 1: Dry-fit and bond Plane 1 textures: Following my Week 1 elevation, I position corrugated fluting in the recessed bays while keeping the triangular sky voids clean.

Step 2: Engineer and bond Plane 2 laminated spans: I cut and laminate my primary arch and cantilever beams using a safety ruler, then bond them cleanly over Plane 1.

Step 3: Add plane 3 embossed gussets and prime: I lock the beam intersections with embossed foil gusset plates, apply dark iron primer into the recessed joints, and write my mid-build log note.

Practice routes (Supported / Independent / Aspire)

Supported: Three-plane relief structure assembled, primed in recesses, and logged.

Independent: Three-plane site-specific relief constructed, primed, and critically documented.

Aspire: High-relief undercut structure engineered, base-washed, and analytically logged.

TA and cover notes

TA focus: Count all safety rulers and cutting tools out and back into table blocks; provide small card spreaders so PVA glue is applied in thin, clean films.

Staff prep: Staff preparation only: review how to demonstrate three-plane relief assembly and hidden spacer strips for undercut shadows.
