Solar System Models · Tier Pack · Supported

Learning goal: I can use solar system data and a scale model to link distance from the Sun to orbit time.

Supported Route (Book First)

Put Mercury, Earth, Jupiter, and Neptune in order from shortest orbit to longest orbit and finish the pattern sentence.

Help: Closest = Mercury (88 days). Furthest = Neptune (165 years). Further from the Sun = __ orbit time.

Optional Make It · Supported

Make a 4-Planet Data Match Card

Match Mercury (88 days), Earth (365 days), Jupiter (12 years), and Neptune (165 years) in order of distance and copy the pattern into your book.

Word Help

orbit time: the time a planet takes to travel once all the way around the Sun (its year)

scale model: a model that shrinks huge real distances or sizes using a fixed rule

astronomical data: measurements of planets such as distance from the Sun, diameter, and orbit time

limitation: something a science model leaves out or cannot show accurately

Exit Check

Which planet takes longer to orbit the Sun: Earth (365

days) or Neptune (165 years)?
