

A club asks for scientific advice

Learning intention

Explain how diet, activity, drugs and daily routines can affect the body using a fictional club plan.

A fictional club wants a plan that supports bodies.

Which ideas have evidence and respect different needs?

Useful substances, useful evidence

R1. What carries oxygen around the body?

R2. Name a nutrient or food substance the body uses.

R3. Does “can help” mean “always guarantees”?

I connect a factor to a body effect

Food patterns supply different needs

Starchy foods
provide carbohydrate

Protein foods
supply amino acids

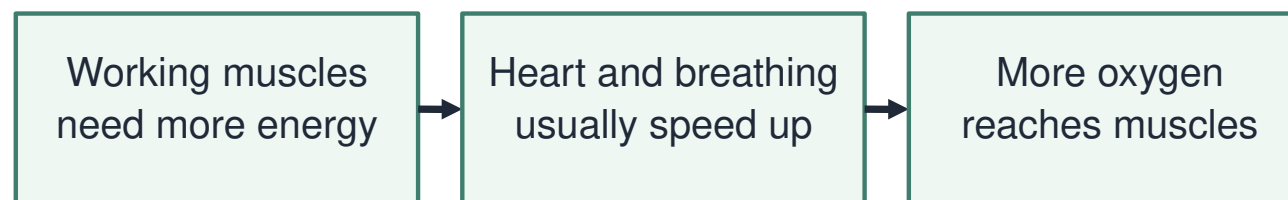

Fruit / vegetables
provide fibre
and more

Food groups overlap. Variety over time matters;
this is not a list of good and bad people or foods.

I name the factor: overall diet. I explain the effect: supplying different nutrients. I avoid judging a person from one meal.

I explain an activity effect

During suitable physical activity

Activity can be adapted. Our lesson tests claims on paper; nobody must exercise for evidence.

During suitable activity, muscles usually need more oxygen. Heart and breathing can speed up. Regular suitable activity can support health.

I treat drug claims carefully

One substance can have more than one effect

Intended benefit
May treat or prevent
a condition

Directions matter
Right person, dose
and timing

Other effects
Side effects can
also occur

Use prescribed medicines as directed.
Ask a pharmacist or prescriber about questions.

Medicines change how the body works. Helpful effects and side effects can both occur. Scientific advice respects proper directions.

The adviser board

Use source cards A–F and proposals P–S. W1. Keep, adapt or reject each proposal. Give one evidence-card reason.

Proposal	Fictional plan	Evidence check
P	Varied food-choice cards; water access	Uses diet evidence
Q	Optional adapted movement; quiet alternative	Uses activity/access evidence
R	Calm wind-down; smoke-free environment	Uses routine and smoke evidence
S	Stop everyone's prescribed medicine	An unqualified instruction

Proposals are constructed classroom scenarios, not medical advice.

Design for access

W2. Choose two proposals to combine.

Explain a body effect and an access adjustment.

Food is represented by cards; no tasting.

The exaggerated poster

Poster: “Our club guarantees nobody will get ill.”

W3. Repair it using “can support” and a reason.

A medicine has possible side effects

Which statement is scientifically responsible?

- A** Everyone should stop taking it.
- B** It may help when used as directed; ask a professional about concerns.
- C** If it is a medicine, it can never cause harm.

Write the club recommendation

Choose one response route.

Use the source cards to explain body effects.

Include access and one honest limit.

Link, do not list

“We suggest _____ because _____.”

“People can take part by _____.”

“This does not prove _____.”

Check your wording

Have I explained effects on the body?

Have I avoided personal judgement?

Have I kept medicine decisions with professionals?

Evidence before a slogan

Share one scientific reason.

A partner or teacher checks its source card.

Improve an overclaim if needed.

Which access change should we show?

Suggest an accessible way to join the fictional club.

Choose one to add to the final class plan.

Three responsible science statements

E1. Give a diet–body link.

E2. Give an activity–body link.

E3. Explain one medicine precaution.
