

Shared evidence for the life cycle archive

Life cycle archive

Name _____ Date _____

These source-based summaries describe named animals. They are not records from a classroom animal investigation.

A Common frog | amphibian

Eggs are laid in water. Tadpoles hatch, grow legs and absorb their tails as they become froglets. Froglets grow and mature into adults. Reproduction produces new eggs.

C European rabbit | mammal

Young develop inside the mother and are born alive. Newborn kits feed on milk, grow into young rabbits and mature into adults. Reproduction produces new offspring.

E Grasshopper | insect

Egg → nymph → adult. Nymphs grow and shed their outer skeleton several times. There is no pupal stage in this sequence.

B Monarch | insect

Egg → larva (caterpillar) → pupa (chrysalis) → adult butterfly. The pupa is alive and developing. Mature adults can reproduce and produce offspring.

D Robin | bird

Egg → nestling chick → fledgling → mature adult. The embryo develops inside the egg. A fledgling is still a young bird. Adults can reproduce and produce eggs.

F Platypus | mammal

A platypus lays eggs. Young hatch and feed on milk from their mother. This is a mammal that lays eggs instead of giving birth to live young.

W1. Repair “egg → adult → tadpole → froglet”. Explain two arrows in the common-frog cycle.

W2. The monarch display says “egg → larva → adult”. Restore the missing stage and explain what happens in it.

W3. Test “all insects have a pupa” and “all mammals give live birth”. Use E and F to name a counterexample for each. Say, point, move labels or write on paper.

Supported route for the archive

Use cards A-D. Complete the missing stage, then explain the reproduction link.

S1. Complete the missing stage in each row.

Animal	Complete the sequence
Common frog	Egg → _____ → froglet → adult
Monarch	Egg → larva → _____ → adult
European rabbit	Develops inside mother → newborn kit → young rabbit → _____
Robin	Egg → nestling → _____ → mature adult

Stage bank: tadpole / pupa / mature adult / fledgling.

S2. Which named animal has young that are born alive?

A. European rabbit

B. Robin

S3. Complete: Reproduction produces new _____. The adult does not become its own egg.

S4. Name one arrow that shows growth or development. Explain what changes.

Standard route for the archive

Use cards A-D to write or sketch four labelled stage sequences. Use arrows; realistic drawing is unnecessary.

N1. Common frog: give the stages and label the reproductive link.

N2. Monarch: give the stages and explain what happens in the pupa.

N3. European rabbit: begin before birth, then describe the young and adult stages.

N4. Robin: show the egg, nestling, fledgling and mature adult stages.

N5. Why does a circular diagram not mean that the same individual lives again?

Stretch route for the archive

Use all six cards. Your guide must explain the four core examples and avoid false group rules.

T1. Give one correct stage sequence for each of A-D. Add a sentence explaining the link between adult and offspring.

T2. Repair “all insects have a pupa” and “all mammals give live birth”. Use a named counterexample for each.

T3. A diagram spaces all stages equally. Can you infer how long each lasts? Explain and suggest evidence you would need.

T4. Explain why a fledgling robin and a froglet are young stages even though each resembles an adult.

Exit and reflection for the archive

Answer independently using words, pointing or a short spoken explanation.

E1. Name the monarch stage after larva.

E2. Name a young stage for either the common frog or the robin. State which animal.

E3. Explain how reproduction links one generation with the next.

L1. Which label or arrow did your audience help you improve?

My next useful step is

- A. Order stages.
- B. Explain what an arrow means.
- C. Use a named example to test a claim.
