Knowledge organiser

Put one allele in each gamete margin.

Combine one allele from each parent in every box.

Read a genotype probability from the completed square.

Construct a monohybrid Punnett square and explain how gametes combine to predict offspring genotypes.

Aa × Aa · side / top	**A**	**a**
A	AA	Aa
a	Aa	aa

AA : Aa : aa is 1 : 2 : 1. With complete dominance, the phenotype ratio is 3 : 1. The aa chance is 1/4 = 25%.

Put one allele in each margin. Use one from the top and one from the side in each box.

This is a simple model for one gene. A dominant allele is not stronger, better or more common. Each fertilisation is a new chance. Do not use real family traits or ask for personal or medical details.
