Staff answers · shared work

Starter

The second gives a linked mechanism rather than repeating the outcome.

Worked example

Calculate 8/25 as a percentage and interpret it carefully.

8 ÷ 25 = 0.32.

0.32 × 100 = 32%.

This describes the observed fraction in that sample.

It does not by itself prove a general population probability.

Shared evidence task

Explain: DNA is copied before mitosis and chromosome copies separate into complete matching sets. Calculate: 7 ÷ 20 × 100 = 35%. Evaluate: short follow-up cannot establish long-term safety; more appropriate evidence is needed.

Card placements

Card	Group
The length rose from 2.0 to 2.8 mm	Describe
Chromosomes line up at the centre	Describe
Copies separate so each nucleus receives a full set	Explain
A root hair increases surface area for absorption	Explain
The small sample limits generalisation	Evaluate
A benefit is possible, but harms and follow-up matter	Evaluate

Staff answers · Supported

Arrival

1. Describe: State relevant features, events or a pattern.

2. Explain: A reason linking how or why the event happens.

3. Calculate: Relevant working and appropriate units.

4. Evaluate: Strengths or benefits, limitations or risks, and a justified conclusion.

Independent / application

1. Explain: DNA is copied before mitosis. Copies separate so each daughter nucleus gets a complete identical set.

2. Calculate: 7 ÷ 20 × 100 = 35%.

3. Evaluate: Short follow-up leaves long-term safety uncertain; extend follow-up and record later adverse events.

Two-check exit

1. Improve: The sample length increased by 0.8 mm, from 2.0 to 2.8 mm; length alone does not show which growth processes caused it.

2. Explain: It lacks a mechanism. Explain that DNA is copied before mitosis and the copies are shared into two complete sets.

Arrival

1. Describe: State relevant features, events or a pattern.

2. Explain: A reason linking how or why the event happens.

3. Calculate: Relevant working and appropriate units.

4. Evaluate: Strengths or benefits, limitations or risks, and a justified conclusion. Accept a scientifically correct reason that uses the relevant model or evidence.

Independent / application

1. Explain: DNA is copied before mitosis. Copies separate so each daughter nucleus gets a complete identical set.

2. Calculate: 7 ÷ 20 × 100 = 35%.

3. Choose evidence: Keep the decisive benefit or risk comparison, explain what it supports and state one limit; remove irrelevant values.

Two-check exit

1. Improve: The sample length increased by 0.8 mm, from 2.0 to 2.8 mm; length alone does not show which growth processes caused it.

2. Choose evidence: Keep the decisive benefit or risk comparison, explain what it supports and state one limit; remove irrelevant values.

Staff · source and assessment scope

Weekly outcome: Topics 2 to 3 assessment (Dec).

Exact goal: Use command words, selected evidence and a clear scientific link to improve exam-style responses.

Source: Launch/Autumn2_W7_2026-27/SCI_L_A2_W7L2_Topics_2_3_Assessment_Explore.html; revision c4ca8ffab98e6186a9ef2fed3921644b177f0d6d.

Workbook: _authoring/science_2026-27/_toolchain/scheme_references/LAUNCH_SOW.xlsx; LAUNCH Weekly - Autumn B45 Aut2·W7; C45 above.

The classroom checkpoint samples taught Autumn 2 content. It does not assess every topic point or give a [QUAL] grade. Keep raw evidence, access arrangements and actual content support distinct.

Use fictional allele models and supplied study data. No family history, diagnosis or prediction about an individual is invited.

Keep the real first answer, precise feedback and the pupil’s next response. Marking codes require an actual event; clicks or completed boxes give no automatic R, E, Audience or Influence credit.

Spring 1 scheme lines await owner confirmation. Record any unfinished coverage and hand over the evidence without inventing the next lesson.
