Tier pack: Independent route — Independent surface and structure challenge

Pathway: TRACK · Week 3 Part 2 · Big question: How can we combine collagraph relief, foil embossing, and monochromatic wash in an architectural panel?

Independent route studio steps

Step 1: Construct a balanced architectural relief combining corrugated card, laminated girders, gusset plates, and embossed foil.

Step 2: Apply a dark monochromatic wash into recessed planes and wipe embossed high points to create aged patina.

Step 3: Use dry-brush highlights along upper beam flanges to establish a clear light source from above.

Step 4: Record a technical note in your log evaluating which material held the best tonal contrast.

Success check

Resolved architectural collagraph with three-value monochromatic patina and log evaluation.

Key words helper

• collagraph: A textured relief board built by gluing varied flat and bumpy materials onto a base.

• monochromatic: Using dark, mid, and light tones of a single colour plus black and white.

• recessed: Set further back into the surface so it catches deeper shadow.

• patina: The weathered surface look that metal or stone develops over time.

• flange: The projecting rim or edge of a structural steel beam.

Review checklist

[ ] Hold your panel at an angle to the light and check for dark crevices, mid-tone plates, and bright ridges.

[ ] Ensure your technical evaluation note is completed in your studio log.

[ ] Place your panel flat on the drying rack.
