Tier pack: Aspire route — Material implementation and critical development

Pathway: SUMMIT · Week 3 Part 2 · Big question: How do we translate our Week 1-2 studio brief and joint prototypes into a multi-level structural relief build?

Aspire route studio steps

Step 1: Engineer a high-relief three-plane structure incorporating recessed spacers under Plane 3 beams to create dramatic undercut shadow lines.

Step 2: Integrate precision-embossed foil gussets, graduated truss bracing, and contrasting surface grains.

Step 3: Apply a graded monochromatic base wash and write an analytical log entry examining how undercut projection controls light and shadow.

Success check

High-relief undercut structure engineered, base-washed, and analytically logged.

Make-it studio planner

Execute your three-plane structural build.

Options: Plane 1: Recessed fluting & voids, Plane 2: Laminated primary span, Plane 3: Embossed foil gussets, Detail: Undercut shadow spacers

Review checklist

[ ] Hold your board under directional side lighting to verify that Plane 2 and Plane 3 cast crisp shadows over Plane 1.

[ ] Check that all laminated edges and foil corners are bonded flat.

[ ] Store your panel on the rack with your mid-build critical note clipped to your brief.
