Tier pack: Supported route — Material implementation and critical development

Pathway: SUMMIT · Week 3 Part 2 · Big question: How do we translate our Week 1-2 studio brief and joint prototypes into a multi-level structural relief build?

Supported route studio steps

Step 1: Lay your Week 1 brief beside your greyboard base and glue your Plane 1 textured background strips.

Step 2: Laminate and glue your Plane 2 main structural beams over the background leaving clear triangle voids.

Step 3: Attach plane 3 embossed foil gusset plates at the main beam corners.

Step 4: Brush dark primer into the recessed seams and tick the mid-build check on your log sheet.

Success check

Three-plane relief structure assembled, primed in recesses, and logged.

Key words helper

• implementation: Turning a drawn design brief and prototype into the full physical artwork.

• plane: A distinct flat or textured depth level (background plane, midground plane, foreground plane).

• cantilever: A rigid structural beam that projects horizontally beyond its vertical support.

Review checklist

[ ] Hold your board under directional side lighting to verify that Plane 2 and Plane 3 cast crisp shadows over Plane 1.

[ ] Check that all laminated edges and foil corners are bonded flat.

[ ] Store your panel on the rack with your mid-build critical note clipped to your brief.
