Tier pack: Independent route — Analysing curated spaces and audience impact

Pathway: SUMMIT · Week 4 Part 2 · Big question: How do curatorial choices — scale, lighting angle, sightlines, and framing — shape audience meaning in an exhibition?

Independent route studio steps

Step 1: Analyse the gallery case study across the four curatorial variables (Lighting angle, Sightline, Grouping, and Wall text).

Step 2: Conduct a directional raking-light test on your Week 3 relief panel and apply targeted metallic/chalk highlights to the light-catching flanges.

Step 3: Draw an annotated Curatorial wall & Lighting plan showing optimal lamp angles, 15 cm spacing, and sightline alignment.

Step 4: Write a critical paragraph explaining how curatorial decisions control audience perception of relief art.

Success check

Panel enhanced with directional patina, annotated lighting/wall plan drawn, and curatorial analysis written.

Key words helper

• raking light: A directional light source shone across a surface from a low side angle to throw every bump and recess into deep shadow.

• curatorial intent: The deliberate mood and visual journey a curator designs through spacing, height, and lighting.

• juxtaposition: Placing two artworks side by side so their scales, textures, or forms highlight each other.

• interpretation panel: The wall text and labels that frame the context and technical process for visitors.

• spatial hierarchy: Using central placement, breathing space, and spotlights to signal key focal works.

Review checklist

[ ] Shine the directional lamp across your panel one final time to confirm your dry-brush highlights match the raking light angle.

[ ] Check that your Curatorial analysis board includes both your lighting diagram and audience impact notes.

[ ] Store your resolved relief panel safely for the showcase.
