Staff answers & diagnostic guide — Piloting, leading and adapting the studio session

Pathway: SUMMIT · Week 6 Part 2 · Big question: How do we run a live pilot of our workshop sequence, spot material bottlenecks, and adapt our instructions?

Starter answer & explanation

Question: What is the smartest response if, during your pilot run, your participant runs out of time on Step 2 (cutting and laminating strips) before reaching Step 3 (patina)?

Correct: Adapt your prep kit by pre-cutting the strips beforehand so Step 1-2 takes two minutes and leaves plenty of time for Step 3 — Exactly! Adjusting the material prep removes the bottleneck so the participant reaches the exciting finish.

Guided team check (We do) answers

Q1: While your partner is trying your workshop steps during the pilot, what should you be watching for? -> Any moment where they pause in confusion, struggle with tool pressure, or take longer than the timer allows (Yes! Those exact moments of hesitation tell you where to add a clearer cue or prep tweak.)

Q2: Which of these is a high-impact 'Workshop adaptation' to record on your log sheet after the pilot? -> During the pilot, wet wash pooled on the foil; I added blotting tissue to the tray and a 'dab within 5 seconds' cue on Tile 3 (Spot on. It links a real pilot observation to a concrete material and instruction fix.)

Q3: What should you do with the sample tile your partner made during your pilot session today? -> Mount it on your Pilot adaptation sheet as live proof that a peer successfully followed your workshop! (Correct! A peer-made pilot tile plus your adaptation note is unbeatable evidence.)

Exit check answer

Question: Why do we mount the sample tile our partner made during the pilot onto our studio log sheet?

Correct: It provides tangible evidence that a participant tested our workshop instructions and shows the outcome that informed our adaptation — Correct. The participant tile plus your adaptation note proves real-world testing.
