Autumn 1 · Body science

I can use models and evidence to show what I know about skeletons, muscle pairs, nutrition, balance and food sources.

Words

Word	It means
skeleton	the bones that support and protect the body
joint	a place where bones meet and move
contract	a muscle gets shorter and pulls
nutrient	a useful substance from food
vertebrate	an animal with a backbone
food chain	a path showing what eats what

Skeletons and classification

Skull protects brain. Ribs protect heart and lungs. Bones support the body. Vertebrate: backbone. Invertebrate: no backbone.

A muscle pair

Biceps contracts. Triceps relaxes. To straighten: triceps contracts, biceps relaxes.

Nutrition and body jobs

Carbohydrate: energy. Protein: growth and repair. Calcium: bones and teeth. Foods contain several nutrients. A varied diet provides different nutrients. Sugar per 100 g is only one part of nutrition evidence.

Balance and evidence

Narrow 2/5. Wide 5/5. Same model height and mass. Five similar taps. Wider feet: upright 5/5; narrow: 2/5. Invented teaching data.

Food sources and transfer

GRASS → RABBIT → FOX. Grass makes food using light. Arrows show food and energy passing to the animal that eats it.

Connected explanation

Food provides energy. Muscles use energy to contract and pull bones at joints. Models help explain this, but simplify real bodies.

Model steps

1. The biceps contracts and pulls on the forearm.
2. The triceps relaxes while the elbow bends.
3. For the reverse movement, the partner muscle pulls.

How I know

- Show one idea about bones, moving, food and where food comes from.
- Join two science ideas with the word because.
- Use a model or the evidence to back up what you say.
