Worked costing and my revised budget

Practice figures only. These are not shop prices, a recipe or our real budget.

Cost used in one batch	Practice amount
Flour	£0.80
Sugar	£0.60
Fat	£1.20
Eggs	£1.20
Cocoa	£1.00
Food total	£4.80
Packs for the batch	£1.20
All batch costs	£6.00

One batch and twelve pieces

£6.00 ÷ 12 = £0.50 cost for each piece.

A practice price is £1.00 for each piece.

12 × £1.00 = £12.00 from sales.

£12.00 − £6.00 = £6.00 left after costs.

This assumes all twelve pieces sell. There are no other costs in this model.

If fewer sell, less money may be left. Check the real costs before we set a price.

Hinge answer: B £6. A is all sales money. C is the cost of one piece.

Project plan reference: _____ Target reference: _____

Check the costs of food we will use. Add packs and other costs. You can use a calculator.

Item	Pack price	Pack size	Amount used	Cost used

Cost used = pack price × amount used ÷ pack size. Use the same units for both sizes.

My checked figures	Amount
Food cost + packs + other costs	£
Total batch cost	£
Pieces fit to sell in a batch	
Batch cost ÷ pieces = cost per piece	£
Price × pieces we plan to sell = takings	£
Takings − agreed costs = money left	£

Product	Batches	Pieces to sell	Price each	Final or pending

My sources and dates: __. Waste or unsold pieces allowed for: __. Extra costs: __.

Adult cost and safety check: __. Date: __. If a key fact is missing, keep this pending.
