

Online risks and a safer digital footprint

Today: edit River's fictional practice profile and respond to fictional message cards.

We will not open personal accounts, share passwords, send messages or publish a profile.

What can we practise without revealing our own online lives?

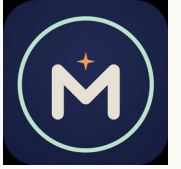

Words that help

DIGITAL FOOTPRINT

Information connected with someone's online activity, including material others add.

PERSONAL INFORMATION

Details that identify someone or reveal information about them.

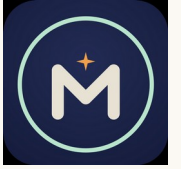

A footprint has different sources

A person's posts and comments can add information. Other people may also post, tag or share material about them.

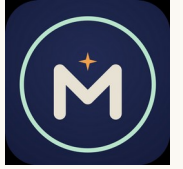

Services may hold activity data too; not every trace is publicly visible.

Some details reveal more when combined, such as a name, badge and location.

A footprint has different sources — continued

Can a person have an online footprint without posting their own photo?

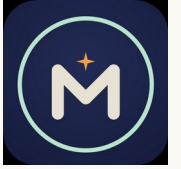

Check the request, not the friendly name

A message says, “You have won a device. Send your password now to claim it.”

It could use a friendly name or look official. Good spelling does not prove it is genuine.

Pause and ask an adult; do not follow the message’s link or send secret information.

Check the request, not the friendly name

Which features make the request concerning?

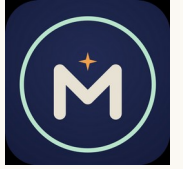

A positive topic can still reveal too much

A certificate photo may show a full name or school.

A hobby post can be general, or it can reveal a regular location and time.

A kind comment can still include someone else's private information.

Is “it is about an achievement” enough to call a post safe?

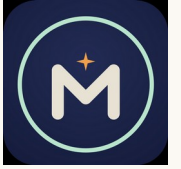

We do: reduce a fictional profile's exposure

Open GROW_W6_Fictional_Profile_Starter.docx. Keep River as a fictional display name and the general drawing interest.

Remove the school and live-location fields from this practice copy.

Replace the certificate-photo line with a general text description that contains no identifying details.

We do: reduce a fictional profile's exposure

Why is this a useful edit?

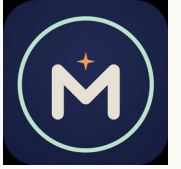

Private and deleted are not guarantees

Privacy settings can reduce who sees content, but an allowed viewer may copy or share it.

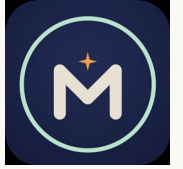

Deleting a post may help remove that copy; screenshots or other copies may remain.

People can still seek help with removal or unwanted sharing. It is not “too late”.

Private and deleted are not guarantees

Improve: “Deleting never helps, because everything is online forever.”

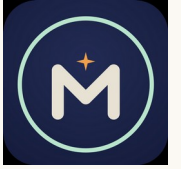

You do: fix the advice as well as the details

Replace “Only friends can ever copy this” with an accurate privacy sentence.

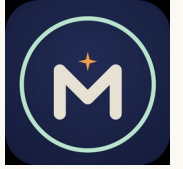

Replace the plan to send a password with a safe pause-and-help response.

Save the offline copy as GROW_W6_River_Profile_Safer_v1.docx.

You do: fix the advice as well as the details

What should the password-message response say?

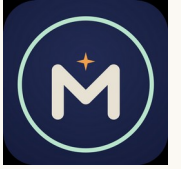

Pause, get help and use the right route

If an online situation worries someone, they can stop interacting and tell a trusted adult.

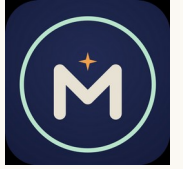

Adults can help use the platform's reporting/blocking tools or school IT/safeguarding route.

If a pupil already clicked or shared something, prompt help still matters. They should not be blamed.

Pause, get help and use the right route

Must someone handle the whole problem alone before telling an adult?

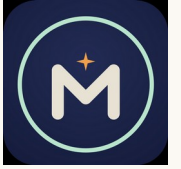

Check your edited profile and response

Task 1: identify the risk and a clue on each card.

Task 2: make and explain edits to River's offline practice profile.

Task 3: correct an overclaim and choose an available help route.

What should a final check look for?

A safer next action

River already clicked a worrying link and feels embarrassed.

The fictional profile is still an offline classroom document.

What would you advise River to do next?
