Measuring and plotting jobs

White standard edition

Record growth (links Science).

Practical jobs

1 Find the original tray and marked shoot code. Check the earlier method.
2 Read height in cm without pulling or stretching. Use the same endpoint and precision.
3 Count whole expanded leaves as the adult shows. Describe condition.
4 Recheck an unexpected value and record only actual observations.

For a new height method, measure vertically from the medium surface to the main-stem growing tip. Record the chosen precision, such as nearest cm. If earlier methods differ, mark a series break.

No visible shoot means no measurable height. Do not replace it with a model value. You may observe, read the ruler, point or record.

The group line graph

Choose one genuine series for the same marked shoot. Check earlier records and include today’s figure. Week goes across; height in cm goes up. Choose equal height steps that fit the real values. Plot and join only neighbouring weeks with reliable measurements.

Leave unavailable points empty and break the line. If only one verified value exists, plot one point without a trend claim. Do not join measurements from different plants as if they show one plant over time.

My one line

Our recorded pattern shows ____; one possible influence is ____.

Describe what the real graph supports. Light, water and warmth are possible influences, not proven causes from the graph alone. Park rulers, clear spills and wash hands. Tell the adult before a quiet pause.
