Comparing our growing trays

Record growth (links Science).

Gardening and enterprise
Resilience & Change

Our tray history check

Find the actual tray codes and Week 2 records.

Which factor differed, and what stayed comparable?

If the history is unconfirmed, say so in our conclusion.

A current comparison does not establish a past fair test.

Fair comparison checks

Check	What the actual records need to show
One factor	The intended change and its history.
Comparable start	Crop, age, seed number and baseline.
Other conditions	Container, medium, care and measuring method.
Limits	Small numbers, gaps or unconfirmed controls.

Keep both trays in suitable care. Do not impose extreme conditions.

Our actual tray comparison

Measure the selected shoots with the same method.

Record height, whole leaves and condition for each tray.

Compare the figures without guessing missing values.

Keep earlier entries. Mark any changed method or moved plant.

An evidence decision

The tray records do not show how conditions differed.

A Invent a treatment history to complete the task.

B Compare current figures and explain the limit.

Which choice gives an honest conclusion?

Invented comparison model

Observation	Tray A	Tray B
Position	Brighter	Dimmer
Week 2 height	3 cm	3 cm
Week 5 height	10 cm	14 cm
Week 5 whole leaves	4	3
Condition	Green and firm	Pale and leaning

Invented model only. Taller does not automatically mean healthier.

Our short conclusion

Our figures show ____.

This may relate to ____, but ____.

Add the real Week 5 growth and care entry.

Use your own measurements and state an evidence limit.

Clear up and exit

Return tools, clear spills and wash hands.

Check our real figures, conclusion and any uncertainty.

Keep care suitable and confirm the next adult check.

Record no change, unavailable values or no water needed honestly.
