Normal use load test card

Design and Technology LAUNCH Spring 2 Week 4 Thursday 18 March 2027 P1 Year A

Use the intended one-card load first. A normal-use test checks the job the stand is meant to do. Stop at the first concern. Do not test to failure.

1 Clear and inspect

Put tools down and return them as agreed. The adult checks actual edges, folds, joins, channel, table and safe support. Damaged or suspect edges are handled by the adult. Any actual approved adhesive join must complete the full cure on its checked label before testing.

2 Set up the same test

Use a clear level table. Place the stand in a 160 mm by 120 mm overall table area. Use one actual lightweight paper card 80 mm wide by 60 mm high. Put it centrally in the U channel against the slope.

3 Hands away for 30 seconds

After adult clearance, keep hands away and observe for 30 seconds. Record the actual count, time and result. Stop at the first slip, tilt, bow, loose join, damage, concern or adult stop signal.

4 Remove and inspect

Gently remove the card. Look at folds, joins and channel with the adult. Do not touch suspect edges. A planned test is not a result.

5 Improve and recheck

Agree one safe useful change linked to a real finding. Make it with approved support. Repeat the one-card test with the same card, position, table and 30-second target after adult clearance. Log the actual before and after. A new adhesive repair keeps the recheck pending until its full checked label cure.

Stop signs

Slip. Tilt. Bowing. Loose join. Damage. Concern. Adult stop signal. Stop at the first sign; follow the adult. No one holds the stand steady during the hands-away test. Do not add another card after a stop.

Use the actual approved revised plan if it differs. One-card purpose stays clear. A model demonstration is not a pupil result.

Before and after load test record

Design and Technology LAUNCH Spring 2 Week 4 Thursday 18 March 2027 P1 Year A

In your book or below, record only what was observed. A planned 30 seconds is not an actual timing. Keep the same card, position, level table and timing target for the fair one-card comparison.

Record	Before improvement	After improvement
Actual card count	___	___
Actual time in seconds	___	___
Supported upright or stop sign	___	___
Join fold and channel finding	___	___
Actual role and support	___	___
Actual date and location	___	___

A stopped or missing test

Test stopped / not performed ___. Actual reason ___. Adult next step ___. Keep the result pending if it did not happen. Never copy a target as an actual result.

Optional Stretch comparison

Optional Stretch comparison only: first pass the one-card baseline and ask the adult to clear the next stage. Use a second identical lightweight paper card, then a third, maximum three cards total. Each is 80 mm by 60 mm and made from the same lightweight paper; no added clips, lamination or weights. Observe for 30 seconds at each stage. Remove cards and inspect between stages. Stop at the first concern; never add another card after a stop. Keep card size and material, position, level table and timing the same. The purpose is still one card. This is a comparison, not a maximum load or safety claim.

Record each actual comparison stage separately: card count ___. Actual time ___. What happened ___. Cards removed and inspected ___. Adult clearance ___. No extra-card result is a maximum capacity or safety certificate.
