Hazard records knowledge organiser

Tuesday 2 March 2027 | P2 | 40 minutes | Year A

Humanities | LAUNCH | Spring 2 Week 2 | HUM-LAUNCH-S2-W02

White paper version. Read quietly, point, write, type, speak privately or direct a scribe who reads your words back. You may pass. No public answer or reading aloud is required.

Learning outcome: Track live hazards online; interpret data.

An online catalogue records observed earthquakes. This printed pack freezes three selected records on 30 October 2026. It does not update. Values may be revised later. Use the field name and unit before making a claim.

Field	What it tells us
UTC date and time	When the event began, using one shared time standard.
Magnitude	A reported measure of earthquake size. It is not a count of damaged buildings.
Depth in km	How far below the surface the earthquake began.
Latitude and longitude	The point’s north or south and east or west position.

Plotting

Round only for the map: A 28 N, 140 E. B 14 S, 166 E. C 8 N, 81 W. D1 has lines every 30 degrees. Plot between lines. The catalogue table keeps the precise source coordinates.

Claims with evidence

A is newest and deepest. C has the largest recent magnitude. B is shallowest. Support each claim with its value. The table cannot rank damage or predict the next event.

Historic comparison

H is Japan on 11 March 2011, magnitude 9.1, depth 29 km. It continues the Week 1 case. It is not one of the recent October 2026 records.

Where this leads: Geoscientists and data analysts check dates, units and source limits before communicating a hazard claim.
