Scientific distinctions

Heavy or prolonged rain can cause flooding. Surface water may exceed drainage or soakaway capacity and can occur far from rivers; river flooding involves the catchment and channel. Hazard, exposure, vulnerability and capacity are separate ideas considered together. Risk is possible harm, with both likelihood and potential severity relevant. Do not reduce risk to weather intensity alone or equate forecast confidence with certainty.

Scenario and guide answers

All area values are constructed assumptions, not observations or an actual forecast. A: 30 homes/pump exposed, older limited drains and low equipment vulnerable, high likelihood and major potential severity. B: 0 homes/footpath, planned storage and upper route capacity, high likelihood and minor severity. C: 6 homes/only bridge, reliance on one route, medium likelihood and major severity. A/B support greater attention to A under the given assumptions. A/C have the same severity category but different chance. No ordinal multiplication or exact overall risk score is valid.

Measures and missing evidence

Drains may reduce surface water flooding but can be overwhelmed and do not guarantee prevention of river flooding. Protected pump equipment reduces one vulnerability but does not remove housing exposure. A second access route reduces dependence on one crossing but needs land, funds and upkeep. Accept another justified planning option within the scenario. Better evidence could include actual terrain, drainage capacity, expected water paths, access needs, community knowledge, costs and current information.

Routes and dignity

Every route needs own risk factors, an A/B comparison with both axes and a measure with a benefit and limit. Supported can use frames and private reading with actual help recorded. Independent adds factor changes and the guide’s limits. Aspire adds C, missing evidence and trade-offs. Vulnerability is not a fault of individuals; explain structural, social and environmental conditions, capacities and support. No real risk assessment is completed.

Sensitive response

Use calm factual summaries and invented places. No disaster footage, personal testimony, casualty material, forced disclosure or hazardous practical simulation. Use the agreed supervised pause and private re-entry. Follow the normal safeguarding route to the safeguarding lead if a concern is disclosed.

Checks and evidence

Hinge: Two areas have the same heavy rain and the same high chance of flooding. Must their risk be equal? A: Yes, the rain is the same. B: No, exposed people, buildings and their vulnerability can differ. C: Yes, high likelihood means major harm is certain. Answer B.

Parallel check: B has high flooding likelihood but minor severity. A has high likelihood and major severity. Which needs greater attention using these given assumptions, and why? Answer: A, because its possible impact is more severe even though the chance category is the same. This is a planning judgement, not certainty that harm will occur.

Offer to the Communication portfolio. Keep the learner's own idea, an actual adult audience reply, one NS and the learner's response in the same colour, on the same page or usual mode before R. E follows actual evidence banking. Record actual help. A partner's answer cannot establish both learners' understanding.

Actual observation _____ Help _____
Gap and planned follow-up _____ Actual banking _____
