Analysis answers and evidence

A is newest, 25 October 2026. B is shallowest at 10 km. C has the largest recent magnitude, 7.7; the worked MAX excludes historic H9.1. C minus A magnitude values is 1.2, not a simple energy multiplier. A minus B depth is 482 km. At least one computed comparison, its actual method and a valid limit are required in the common finish. The selected snapshot cannot rank impacts, establish a global trend or predict the next earthquake.

Case explanation and judgement

Japan 11 March 2011: Pacific plate subduction, fault locking, accumulated strain and sudden slip. Direct shaking damaged buildings/transport. Sea-floor displacement caused a tsunami and coastal flooding. Mixed service or transport mechanisms are valid when supported. Protection: resistant buildings/retrofits/barriers. Preparation: practised routes/education/supplies. Early warning follows detection, not exact prediction. The first tsunami warning was at05:49UTC about three minutes after origin; estimates were low and updated. Accept a supported judgement about combining measures and their limits, not one prescribed paragraph.

Actual method and digital gaps

Observe the process. Hand analysis shows data reasoning, not spreadsheet operation. An adult typing or scribing does not prove learner digital authoring. Record cells/formulas/actions actually used and the actual report file or book reference, support and highest prompt. Workbook B18 is a worked model. Leave any unobserved digital element as a gap or next check. Do not infer completion of row50 or the unit award from the final appearance.

Six-row closure

Use Six_Outcome_Grid and Banking_Checklist. Rows46–49 need authentic prior evidence references and actual review, not assumed completion. Row47’s offline snapshot does not by itself prove live online use. Current E1 is analysis and E2 report; actual evidence/status/help remain blank until observed. These are scheme outcomes, not invented criteria. Staff verify the authorised record for the unit award separately.

Sensitive response

Keep factual, non-graphic material. No casualty numbers, nuclear detail, forced personal disclosure, disaster simulation or personal testimony. Use a supervised private pause and dignified re-entry. Follow the existing safeguarding route to the safeguarding lead if a concern is disclosed.

Checks and evidence

Tuesday 23 March 2027 | P2 | 40 minutes | Year A

Humanities | LAUNCH | Spring 2 Week 5 | HUM-LAUNCH-S2-W05

Hinge: Which statement belongs in an evidence-based report? A: C had the largest recent magnitude, so it proves C caused the most damage. B: B is shallowest at 10 km, but magnitude and depth alone do not rank impacts; use case evidence for Japan's effects. C: H is a recent October 2026 event because it is in the same pack. Answer B.

Parallel check: Can the three selected October records prove earthquakes are becoming more common or predict the next one? Answer: no. A selected snapshot is not a complete comparable time series and cannot predict the next earthquake. Ask each learner to give a valid limit in their own words.

Offer to the Communication portfolio. Keep the learner's own idea, an actual adult audience reply, one NS and the learner's response in the same colour, on the same page or usual mode before R. E follows actual evidence banking. Record actual help. A partner's answer cannot establish both learners' understanding.

Actual observation _____ Help _____
Gap and planned follow-up _____ Actual banking _____
