Invented model and key ideas

All stories are made up. Use the characters only. No personal stories, family details, accounts, appearance ratings or real incidents are needed. Pair talk is optional. No acted conflict or pupil casualty practice.

Choose the right help

An adult stops responding while resting. There has been no fall or injury. Character A checks that it is safe to approach, checks for a response and shouts for help. A calls 999 at once on speakerphone and follows the call handler's instructions. The adult is breathing normally.

Worked reason

The call is made before waiting to finish a breathing check. The call handler can help with checking breathing. With normal breathing and no suspected injury, the recovery position can help keep the airway open. A stays if safe, monitors breathing and tells the call handler about changes.

Ideas to keep in view

• Check scene safety and response. Call 999 immediately for an adult who is unresponsive; shout for help and use speakerphone.

• Follow the call handler. Gasping or abnormal breathing is not normal and needs the CPR pathway.

• The recovery position helps keep the airway open when an adult is unresponsive, breathing normally and has no suspected injury; keep monitoring.

• A safety worry can be shared with a trusted adult or safeguarding lead. A person need not meet alone or give up a boundary to settle a frightening conflict.

Use words, pointing, drawing, typing or the usual communication aid. An adult may scribe the learner's exact words and read them back. Plan in any language. Record access aids separately from prompts that supplied content.

Invented cases for the pair

Normal breathing

An adult becomes unresponsive while lying down. There has been no injury. Character A has called 999. The call handler confirms normal breathing and guides the helper.

• Which position may help keep the airway open?

• Which two conditions in the case support that choice?

• What must the helper keep checking while help is coming?

Gasping is a warning

An adult does not respond and is only gasping. Character B suggests rolling the adult into the recovery position and waiting. Character A has access to a phone.

• Is gasping normal breathing?

• What should A do immediately?

• Why is waiting in the recovery position unsafe here?

Reader A spots a clue. Checker B explains a reason. Swap for the next case. Use books or usual aids for each learner's own answer. Working alone is valid.

Safe choices and private check

A boundary needs support

Adult Character A repeatedly demands Adult Character B's passwords and becomes angry when B refuses. B feels unsafe. Another character suggests meeting A alone to settle it.

• Which actions are safety warning signs?

• Which next step is safer than meeting alone?

• Who can help, and what changes if danger is immediate?

Private hinge

An adult does not respond and is only gasping. Which action is safest?

A. Call 999 immediately and follow instructions for CPR.

B. Use the recovery position and wait.

C. Wait until a trusted adult has arrived before calling.

Give one reason privately. An adult can read the choices. Use words, pointing or the usual aid.

A safe help route

A character can tell a trusted adult or the safeguarding lead privately. If the first adult is away or does not help, try another trusted adult. If there is danger now, get urgent help. No one needs to prove a worry before asking for help.

Aids pause and review

Task	Words and sentence start
Find a clue	care · claim · clue · boundary The story says ___.
Give a reason	because · safe · respect · support This matters because ___.
Choose a next step	pause · ask · help · adult The character could ___ because ___.
Review the work	first try · next step · own reply A clearer reason is ___.

Visible model

The call is made before waiting to finish a breathing check. The call handler can help with checking breathing. With normal breathing and no suspected injury, the recovery position can help keep the airway open. A stays if safe, monitors breathing and tells the call handler about changes.

Pause card

I would like to use my agreed pause.

Use the agreed pause signal. No public reason is needed. An adult supports the agreed supervised route, a neutral task and a supported return. A learner may pass, observe or catch up privately. Keep supervision in place.

Private help opener

A character could say: Can I talk privately? I need help with a safety worry.

A character can tell a trusted adult or the safeguarding lead privately. If the first adult is away or does not help, try another trusted adult. If there is danger now, get urgent help. No one needs to prove a worry before asking for help.

Learning review

In your book, choose Ready to explain, With a prompt or Need another example for each learning point. All choices start blank. This is a learning check, not a judgement about health, family life or safety. Pass is valid.

Keep the first try. Use one next step and respond in the usual mode. No personal detail is needed.

Recovery position paper sequence

Paper task only. No real calls or practice on pupils. Use these steps only for an unresponsive adult who is breathing normally, with no suspected injury. Call 999 immediately for an unresponsive adult, then check breathing while waiting for the call to be answered. Follow the call handler.

Step 1

Place the nearer arm at a right angle to the body, with the elbow bent and palm upwards.

Step 2

Bring the far hand across and hold the back of it against the nearer cheek.

Step 3

Bend the far knee so that the foot is flat on the floor.

Step 4

Keep the hand at the cheek and roll the adult towards the helper onto their side.

Step 5

Adjust the upper leg so the hip and knee are bent at right angles. Gently tilt the head back and lift the chin to keep the airway open.

Step 6

Stay if safe, monitor normal breathing and response, and report changes to the call handler.

The other pathway

Gasping, absent or abnormal breathing needs immediate CPR guided by the call handler. Do not use the recovery position. If injury is suspected, tell the handler and follow their instructions; do not teach a routine roll.

Calling for help

Give the actual location, what happened, whether the adult responds and whether breathing is normal. Give the caller's contact number when asked. Answer the call handler's questions, follow instructions and report any change. In class, discuss the needed information only; use no real address or number and make no call.

Closing tasks from taught weeks

Use the taught cases from Weeks 1, 2, 3 and 5. No held content is needed. Record each learner's own answer in their book or usual mode.

Task 1

Two fictional adults care for a child. Name two actions that meet the child's needs and explain one commitment.

Task 2

An invented post shows a heavily edited picture and claims that everyone should look the same. Identify one media technique and write a respectful response.

Task 3

Two fictional adults disagree about a plan and both listen. Compare this with repeated password demands and anger at a boundary. Explain which needs a safety response.

Task 4

For an unresponsive adult, explain the early call for help. Distinguish normal breathing from gasping and order the recovery-position steps for the appropriate case.

Task 5

Improve the advice to meet an angry character alone. Give a safer next step, a trusted-adult or safeguarding-lead route and one evidence location from the taught weeks.

Use the model, glossary and sequence card if needed. Staff record the actual support. Not yet evidenced is valid. Ask for a later opportunity rather than invent evidence.
