## The aim

I can make a clear chart and use its data to explain a comparison.

## Choose a chart

A column chart compares separate items using upright bars. A horizontal bar chart can also work.

## Choose the data

Use the item names and their points. Do not plot the whole total as another item.

## Make it clear

Use a clear title and labels. Show the unit points. Start the number scale at 0 with equal steps. Avoid 3-D effects.

## Check a change

Change one source value and check the matching column. The other columns should stay the same.

## My success checks

[ ] I chose the three items and their points.
[ ] I used a clear title, labels and a scale from zero.
[ ] I checked a change, explained a comparison and reopened my file.

## Where this leads

Office and stock roles use charts to explain resource needs. A clear chart and a checked comparison can show a digital skill in an application.
